

Lower Main Plains – Geologic Overview

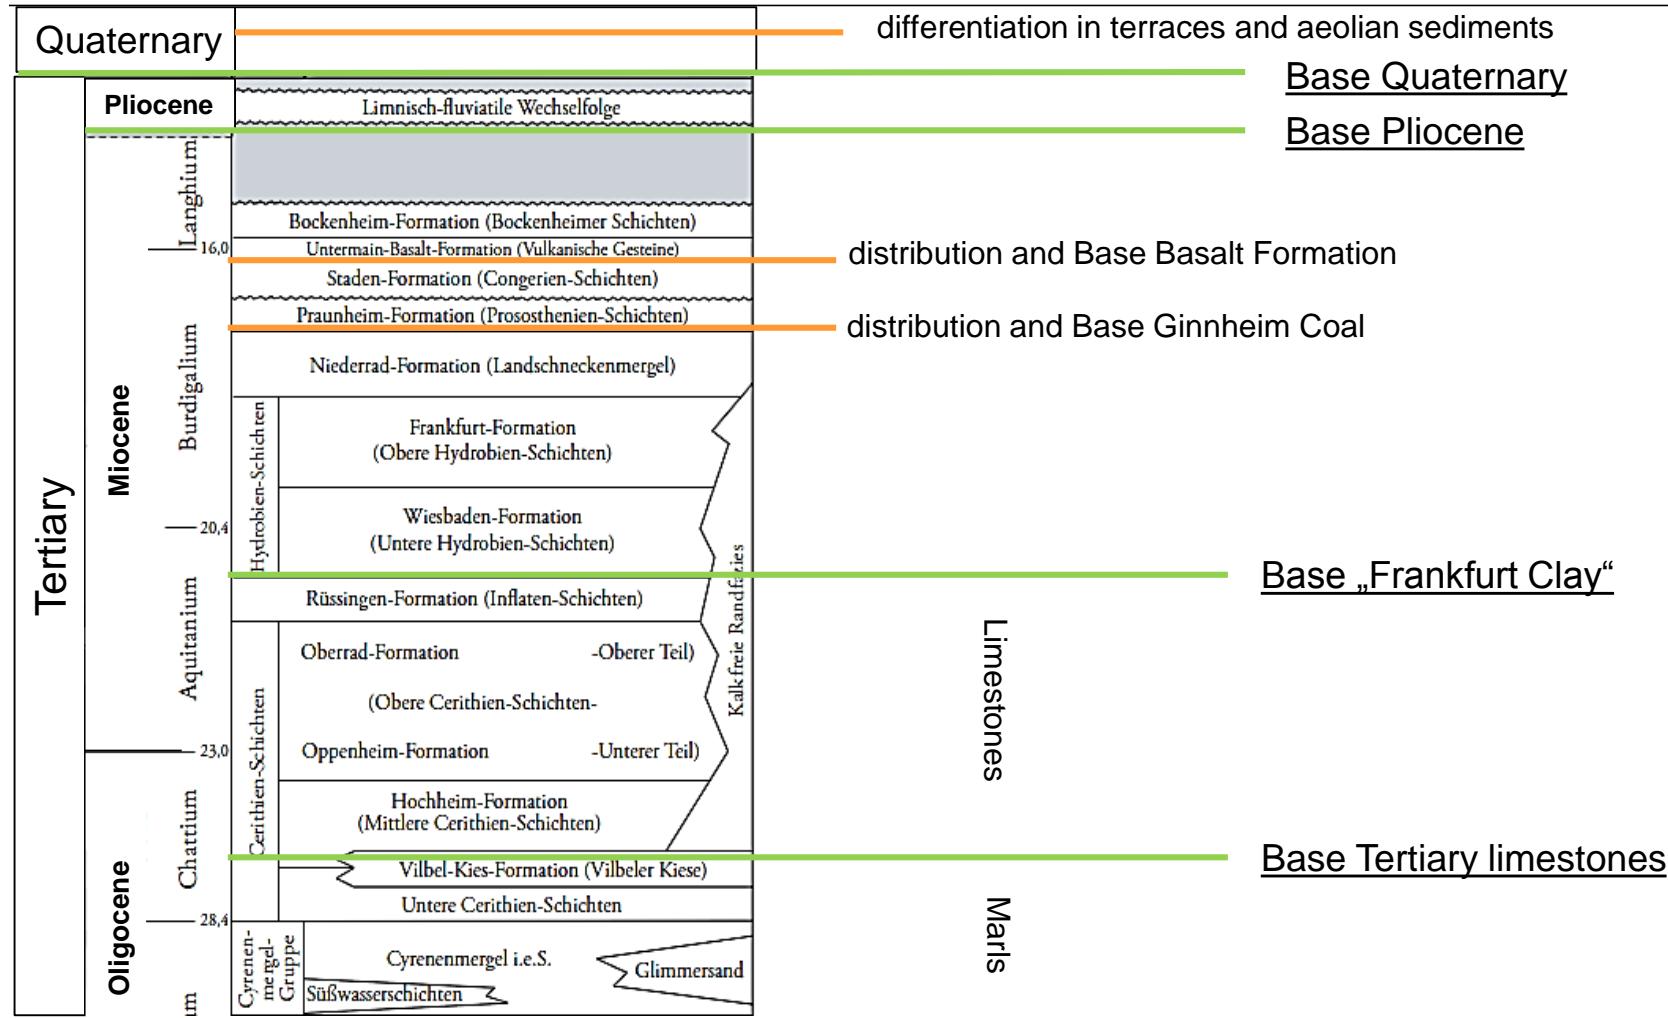

Lower Main Plains - Goals

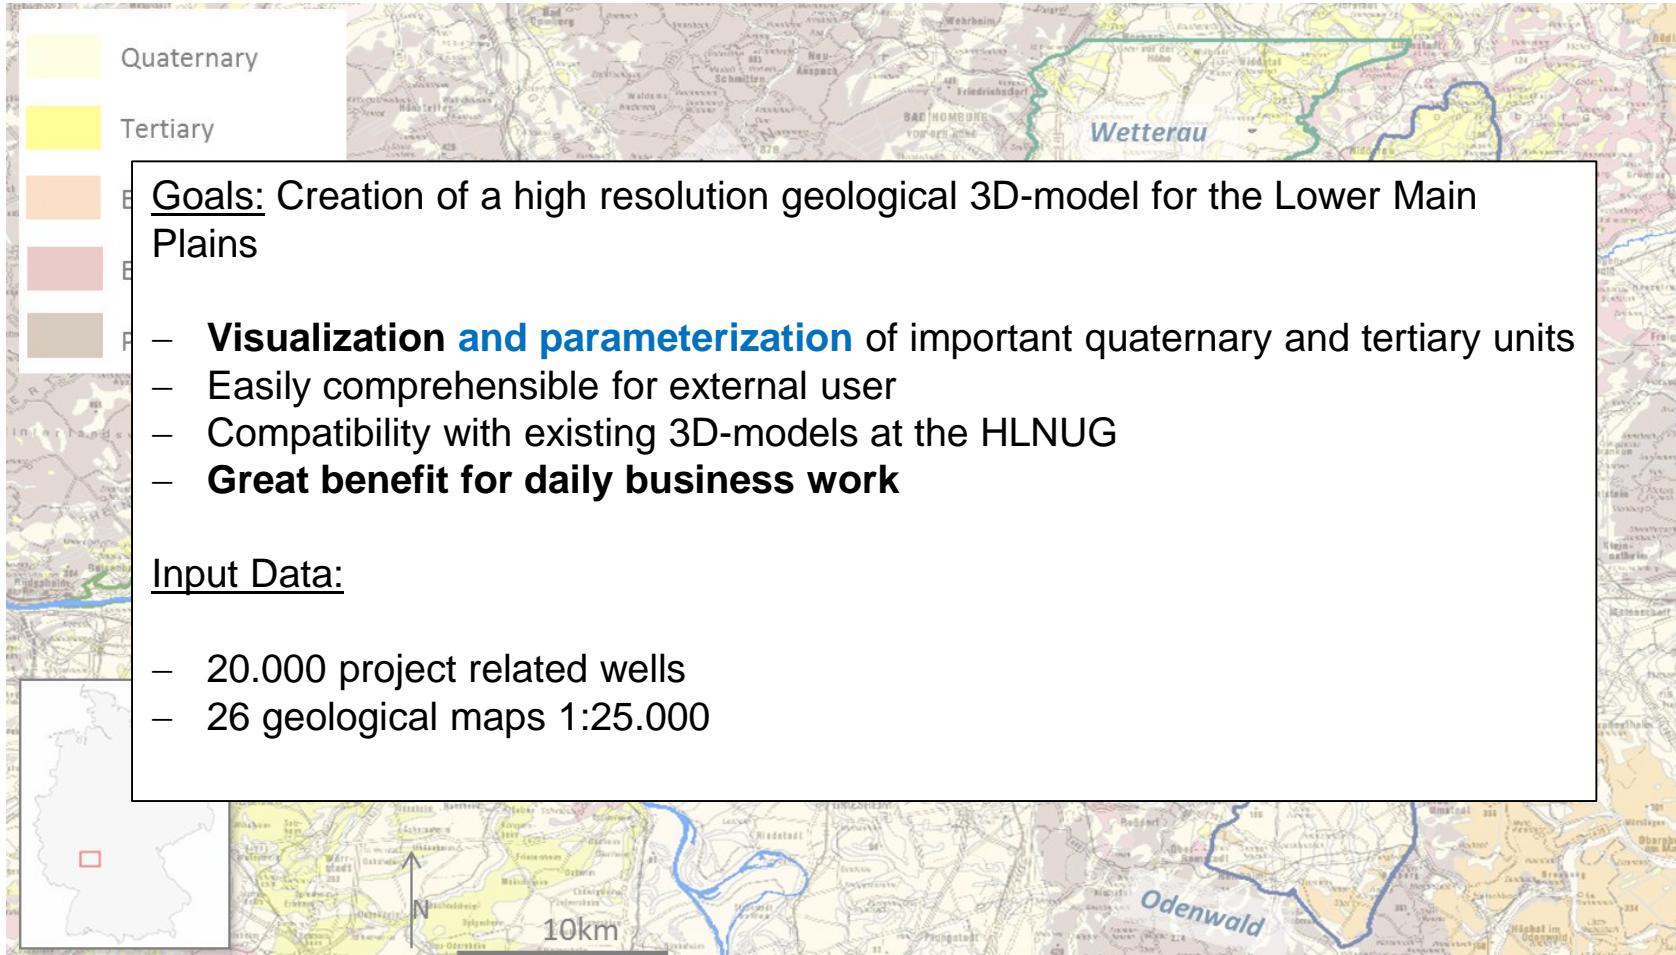

Geologische Übersichtskarte Hessen 1:300.000;
Topographische Grundkarte Hessen 1:200.000

Target Horizons

Modified after Radtke et al. 2009

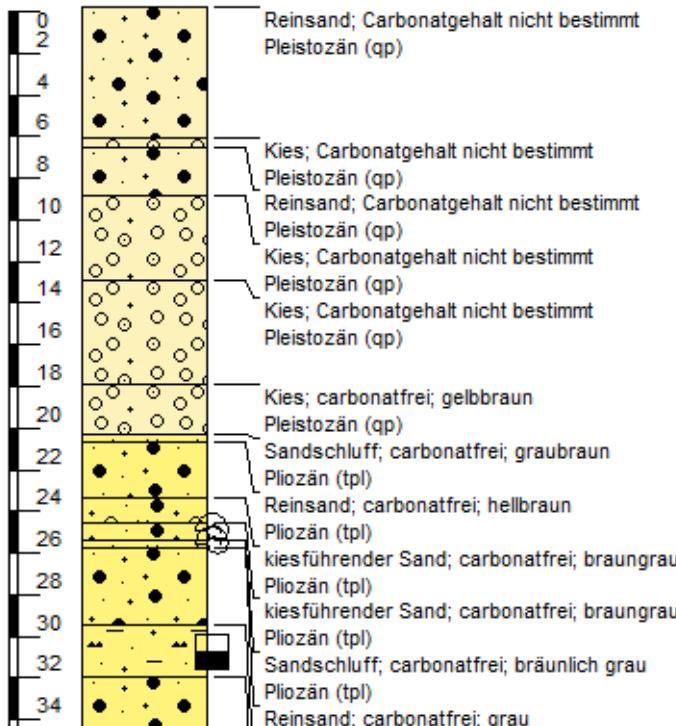

Lower Main Plains - Parameterization

Geologische Übersichtskarte Hessen 1:300.000;
Topographische Grundkarte Hessen 1:200.000

Parameterization Permeability & Lithotypes

Original Well Data

Permeability

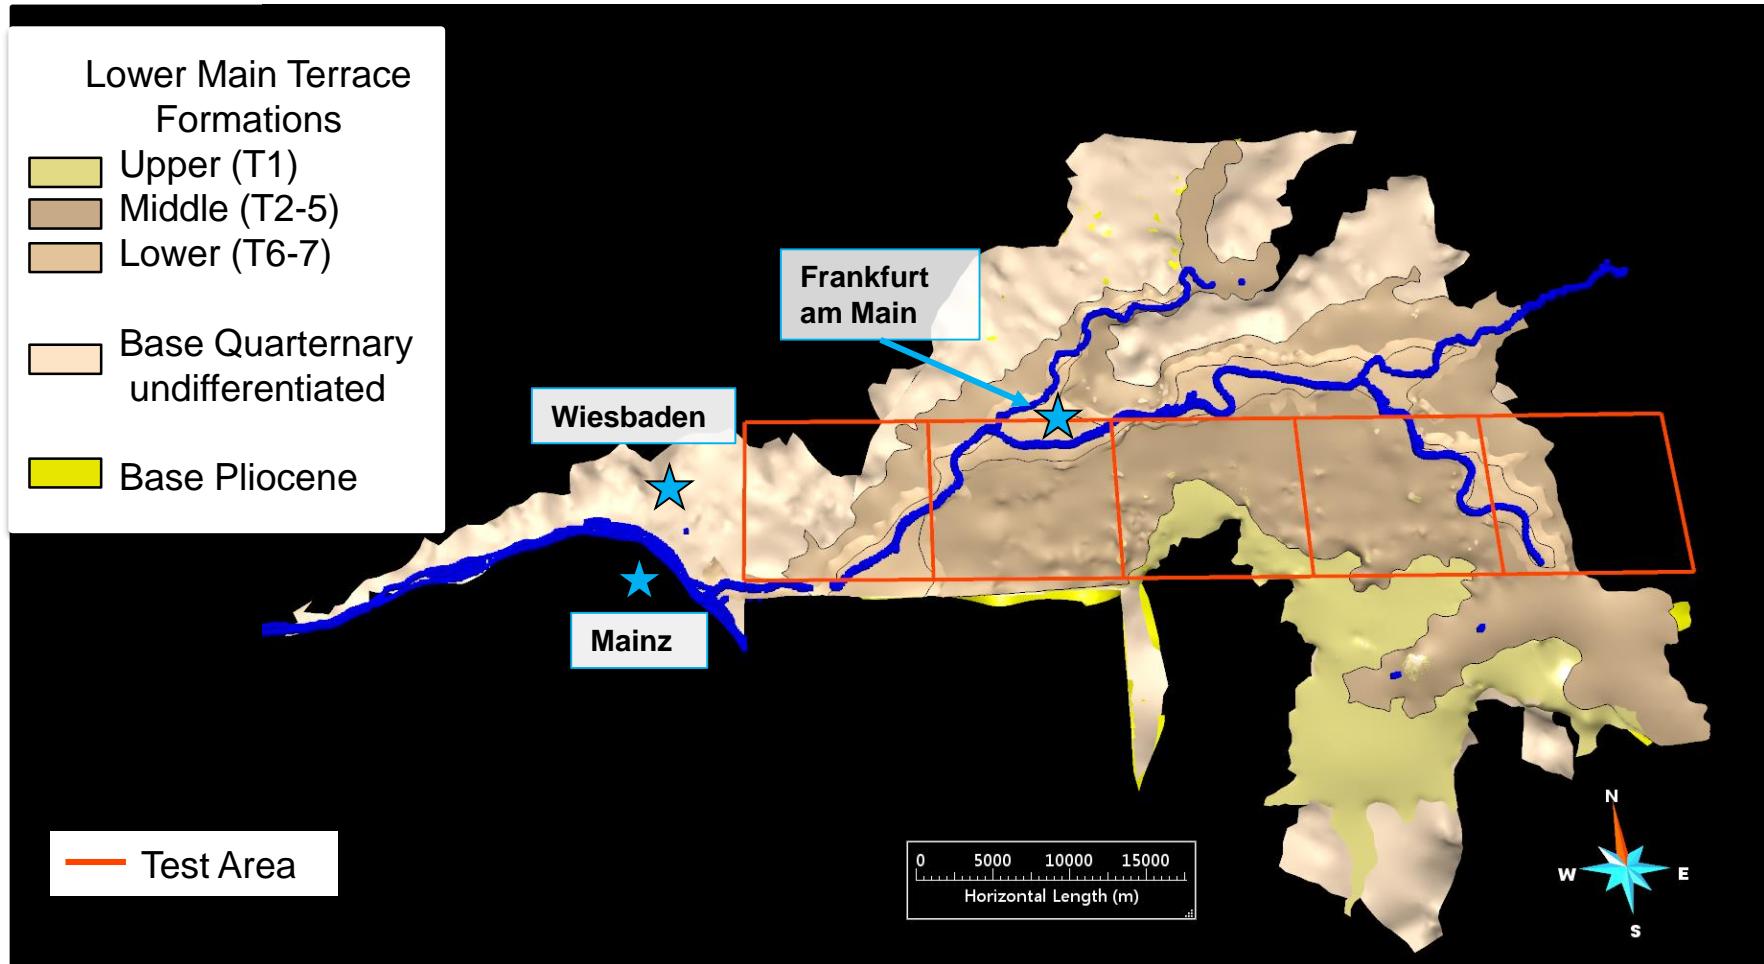

Lithotype

Parameterization

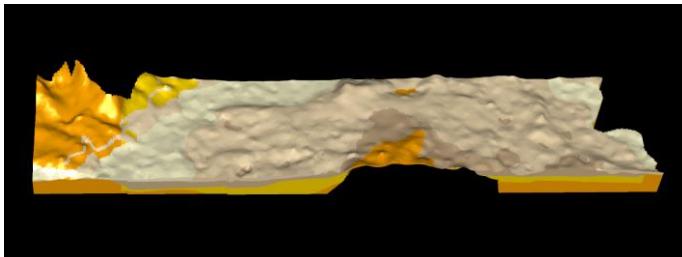

Generalization

Parameterization Surface Model & Test Area

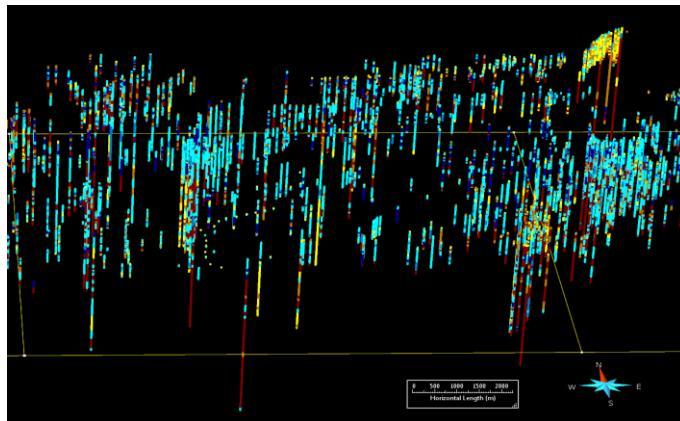

Components for the Interpolation

Volume Grid of modelled Geobodies

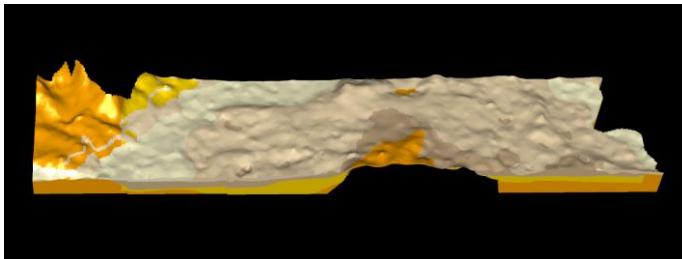

Parameterized Well Data

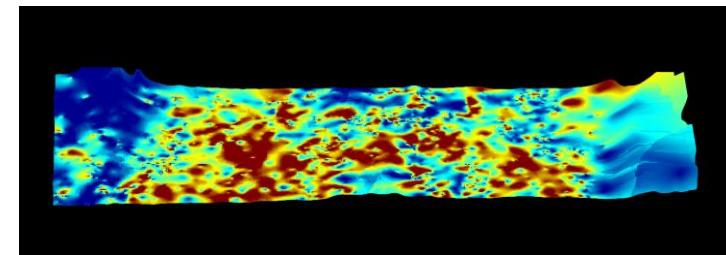

Interpolation

Components for the Simulation

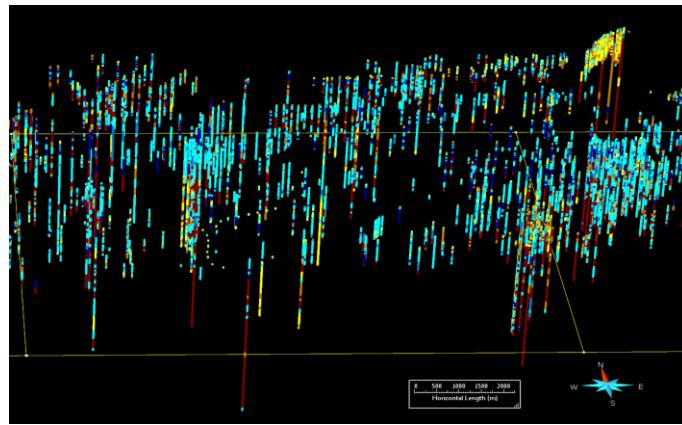

Volume Grid of modelled Geobodies

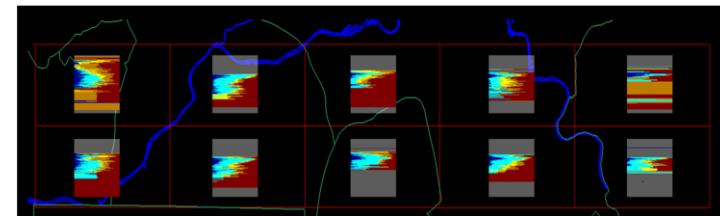

Lithotype Probability Maps

Parameterized Well Data

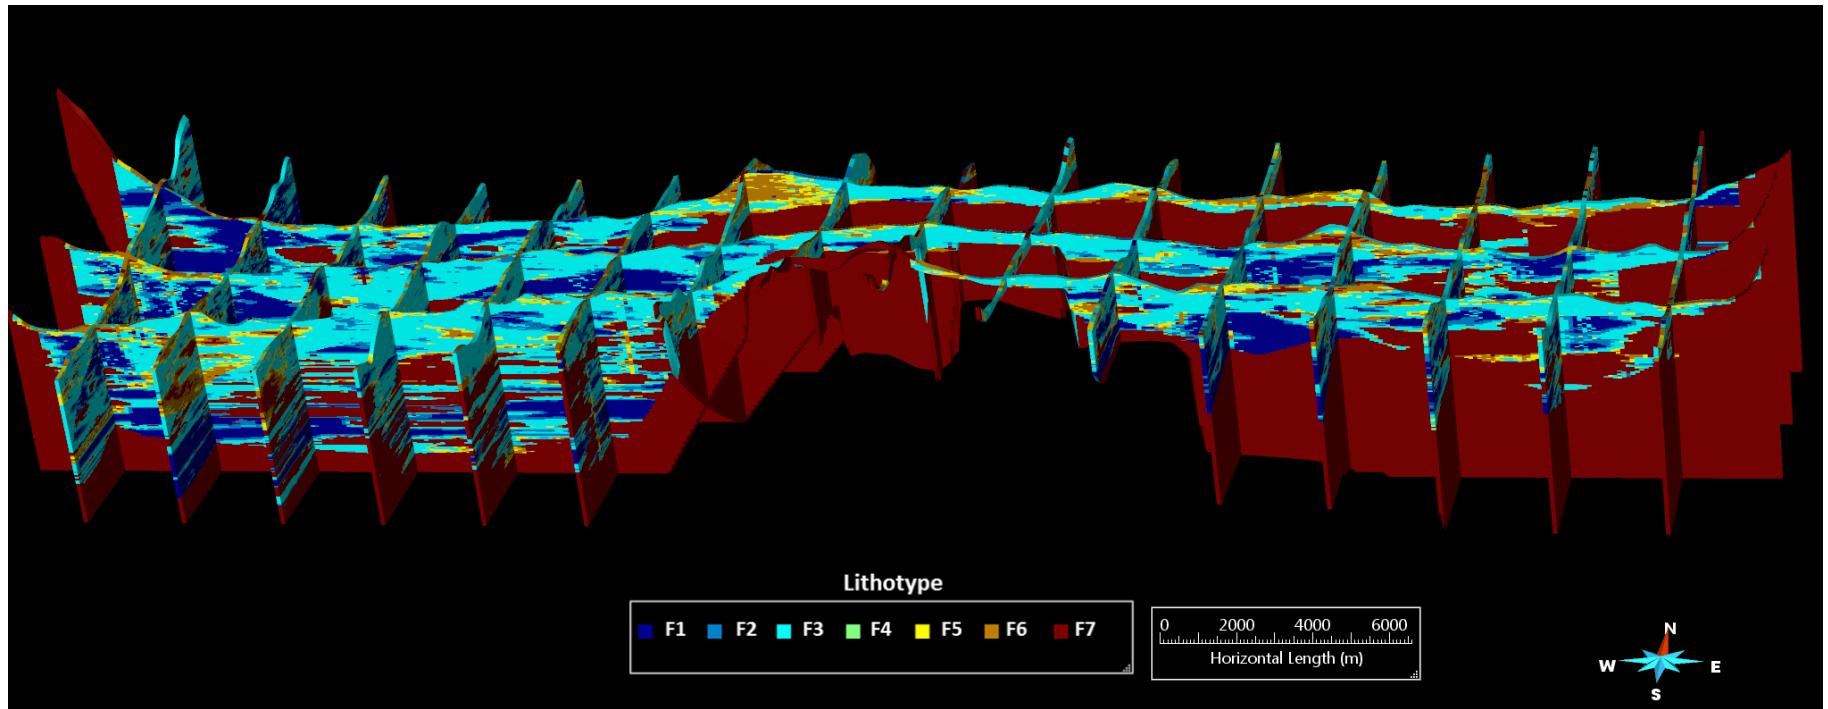

Vertical Lithotype Proportion Curves (VLPC)

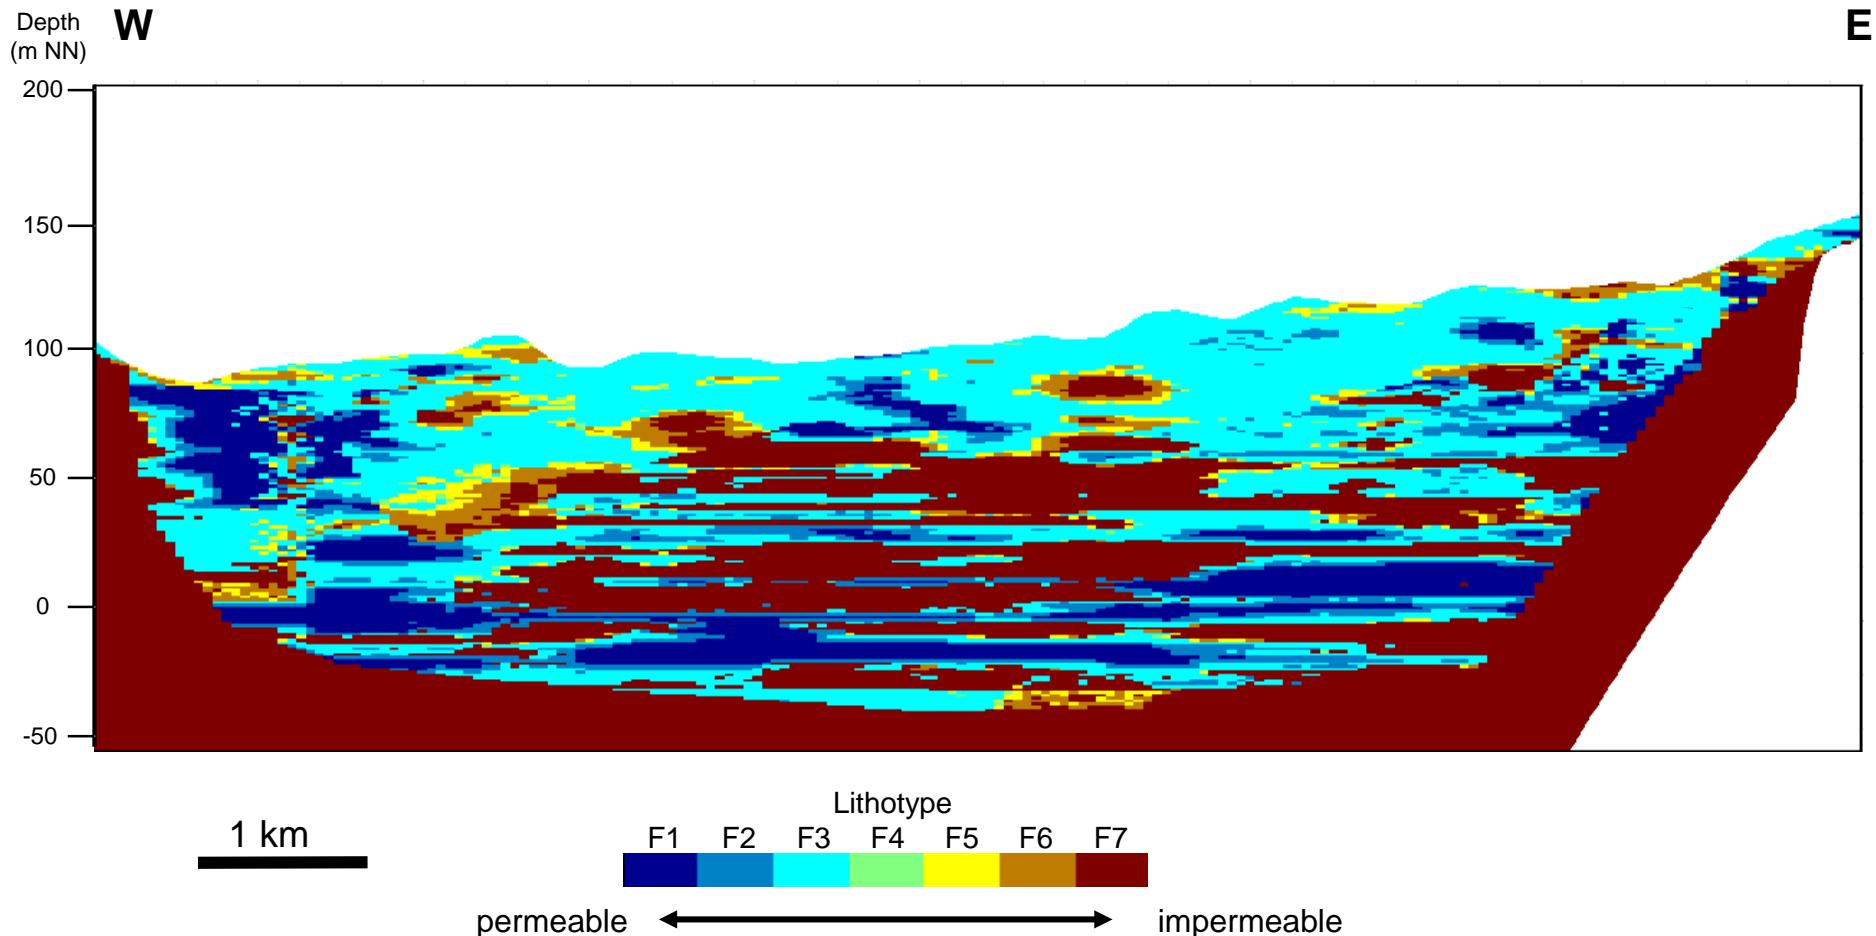

Truncated Gaussian Simulation

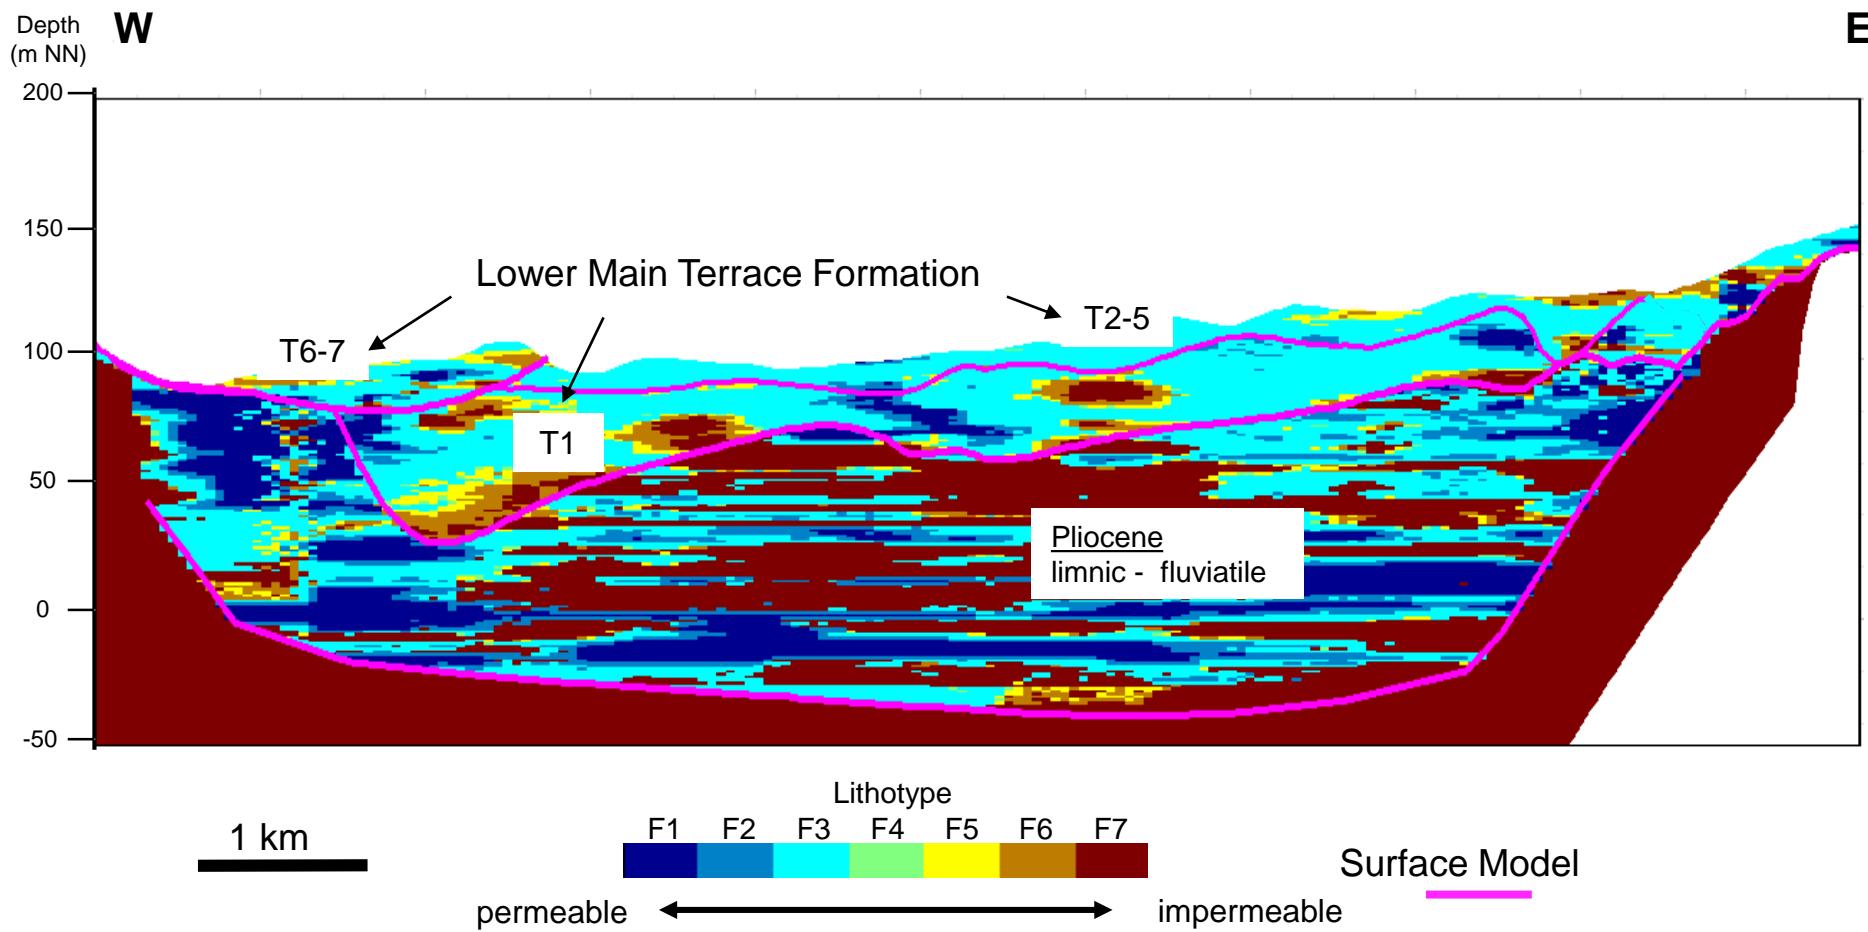

Results – Overview

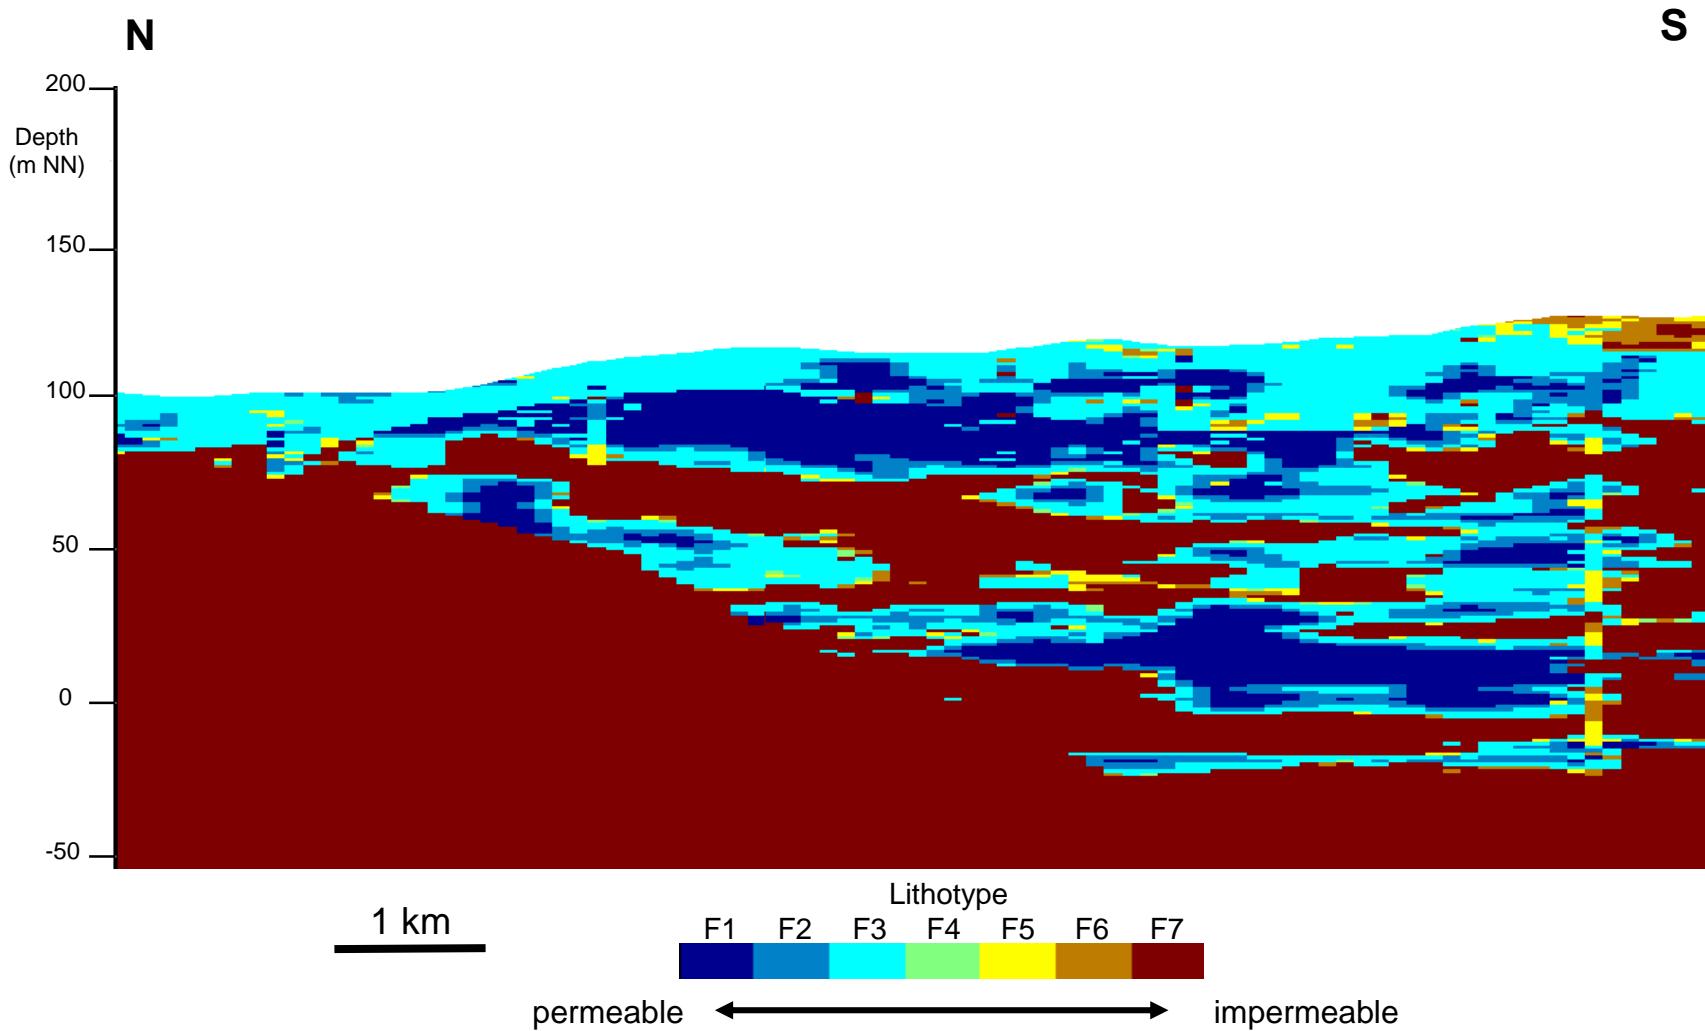

Results – Cross Section W-E

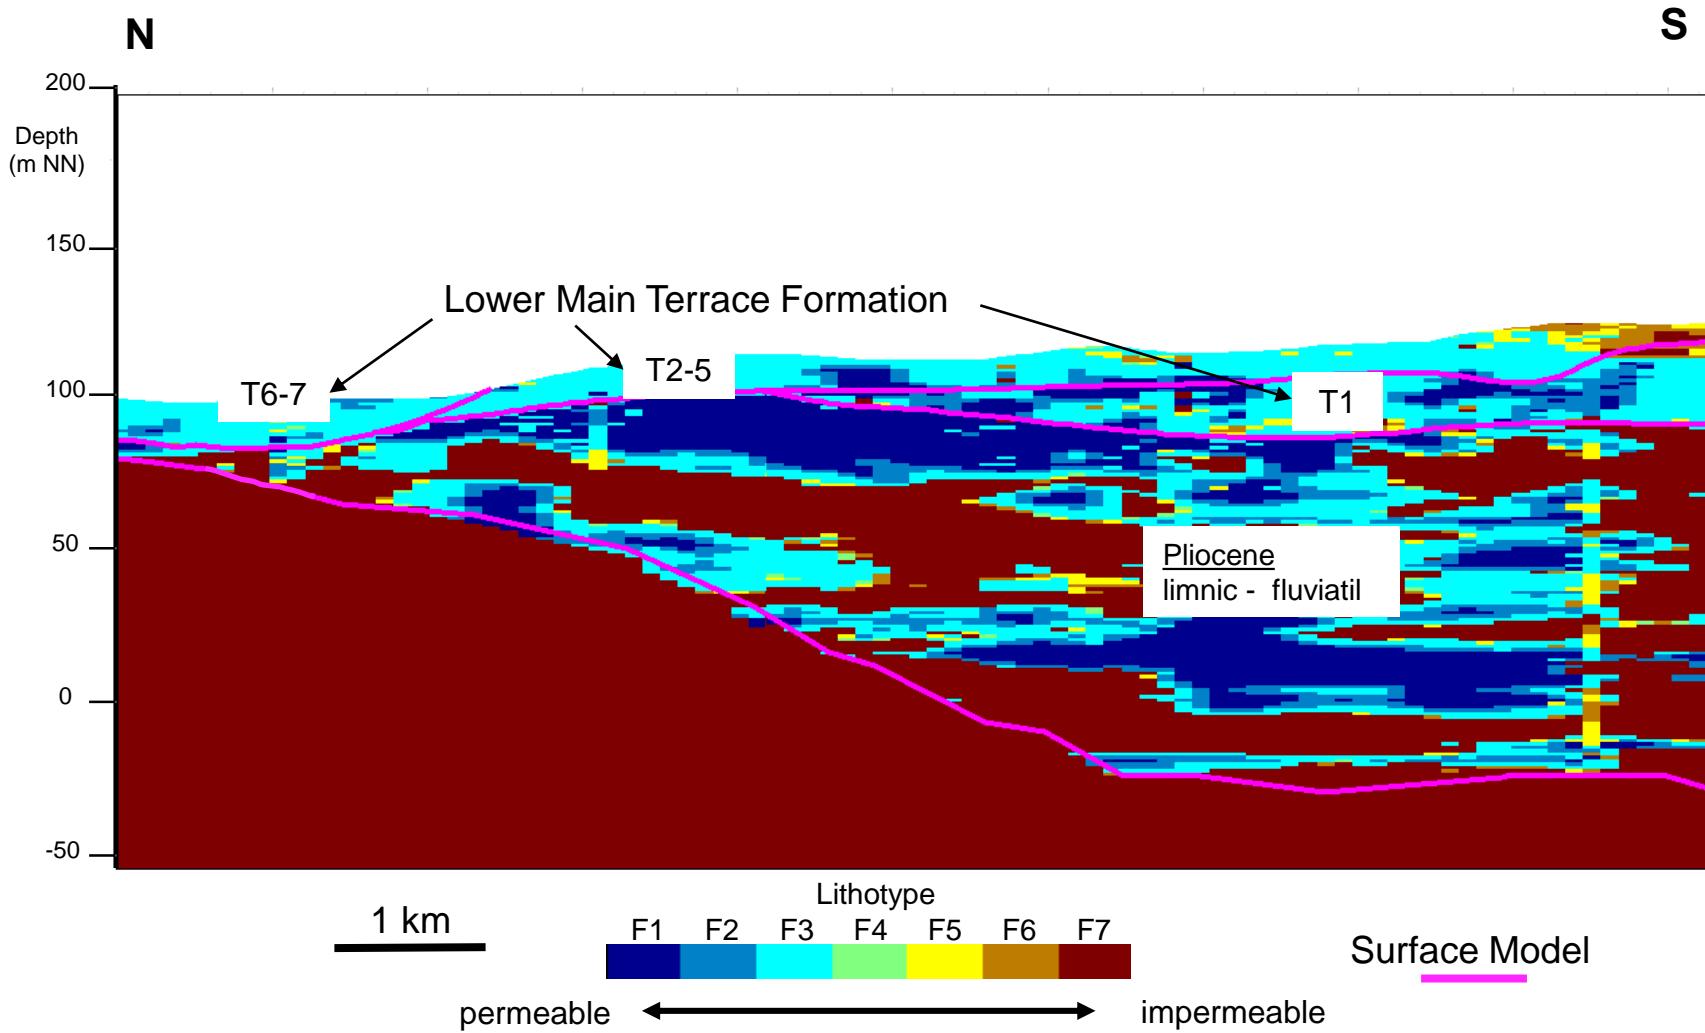

Results – Cross Section W-E

Results – Cross Section N-S

Results – Cross Section N-S

Conclusions & Outlook

- Parameterization of geobodies is a helpful tool to extend the applicability of geological 3D-models
- Trend maps and VLPC can be used as secondary data if:
 - Uneven distribution of input data leads to poor results in interpolation
 - Sharp facies boundaries can be observed in the study area
 - Geological knowledge is not sufficiently represented in the input data (e.g. more data points for unconsolidated rocks)
- Further analyses will reveal whether structures like fluvial channels become visible during parameterization
 - Better understanding of the depositional environment
 - Refinement of the conceptual model

Many thanks for your attention!
